UNIVERSITY FACILITIES

DATE: **July 2, 2012**

RE: **LEAD ABATEMENT**

Attention **Sikes Hall** occupants. Your health and well-being are important to us.

Due to the age of **Sikes Hall** some of the older paint and/or other materials used during construction contain small amounts of Lead. There are two types of materials containing lead that may be present: Lead Based Paint (LBP) and Lead Containing Materials (LCM). Both LBP and LCM are safe to work around as long as they are not disturbed by activities such as dry sanding or scraping.

Please be advised that there will be a renovation project in progress in **Sikes Hall, room 102, July 2, 2012**. As part of this project a small amount of construction/demolition work will need to be done on or around some LBP and/or LCM. The University has hired a special abatement contractor to safely remove this material. This contractor will be sealing this area off from the rest of the building, installing a special filtered air system to ventilate the workspace, and taking other special precautions to ensure that there will not be any release of Lead containing dust into the building air. Additionally, the University has hired an independent testing firm to sample the air both in the workspace and outside the workspace during the work to verify that there is no release.

Please stay clear of any areas with warning tape and signs. As long as you do not enter the sealed workspace, there is no hazard to building occupants.

Questions regarding this notice should be directed to Philip Addington at 643-6161 or padding@clemson.edu.
